

Managing Complex Organizations: Teampay's Multi-Entity Support

With Teampay, organizations have one place to manage distributed spending across multiple subsidiaries. Finance has full transparency and real-time visibility into spend across entities, regardless of how finance operations are configured. As a result, finance teams can streamline month-end close and ensure accurate reporting across subsidiaries.

User Management

The majority of employees will be restricted to their subsidiary. Admins at the parent-level can give specific users access to switch between subsidiaries within Teampay. Those users can make purchase requests for multiple entities within Slack or the web application. Parent-level admins can also easily reassign any user to a subsidiary within the organization.

Funding Account

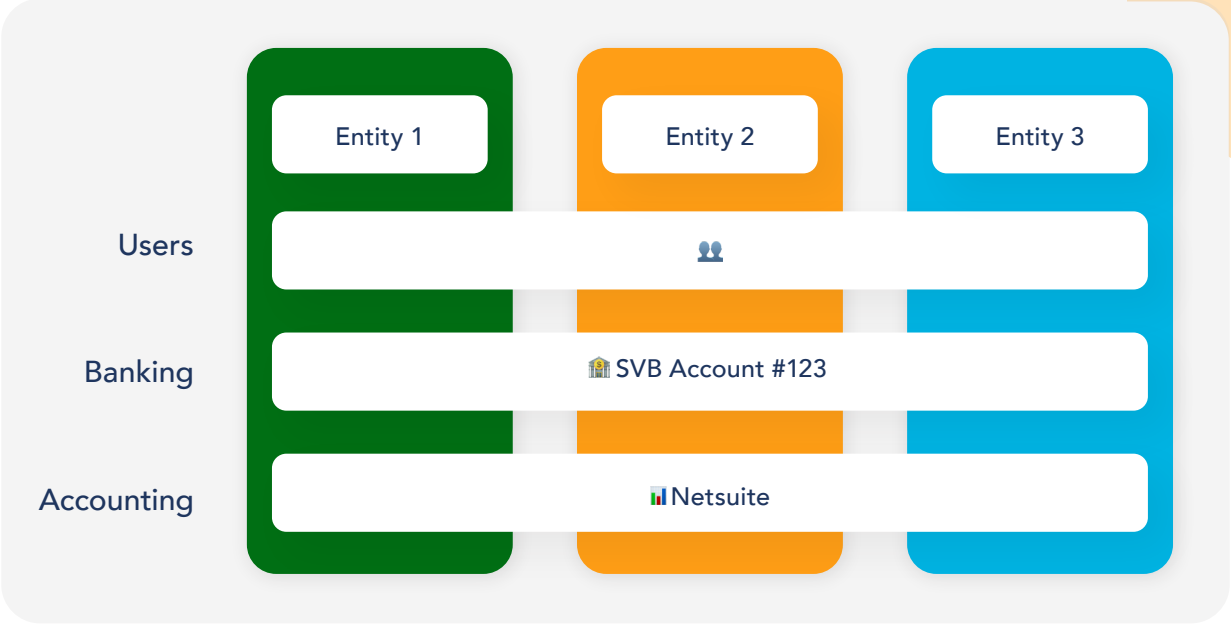

Teampay's multi-entity capabilities support a common funding source across subsidiaries or different funding sources. Teampay supports multiple currencies, with the ability to assign each subsidiary to one foreign currency. Currently, accounts must be funded from a US bank.

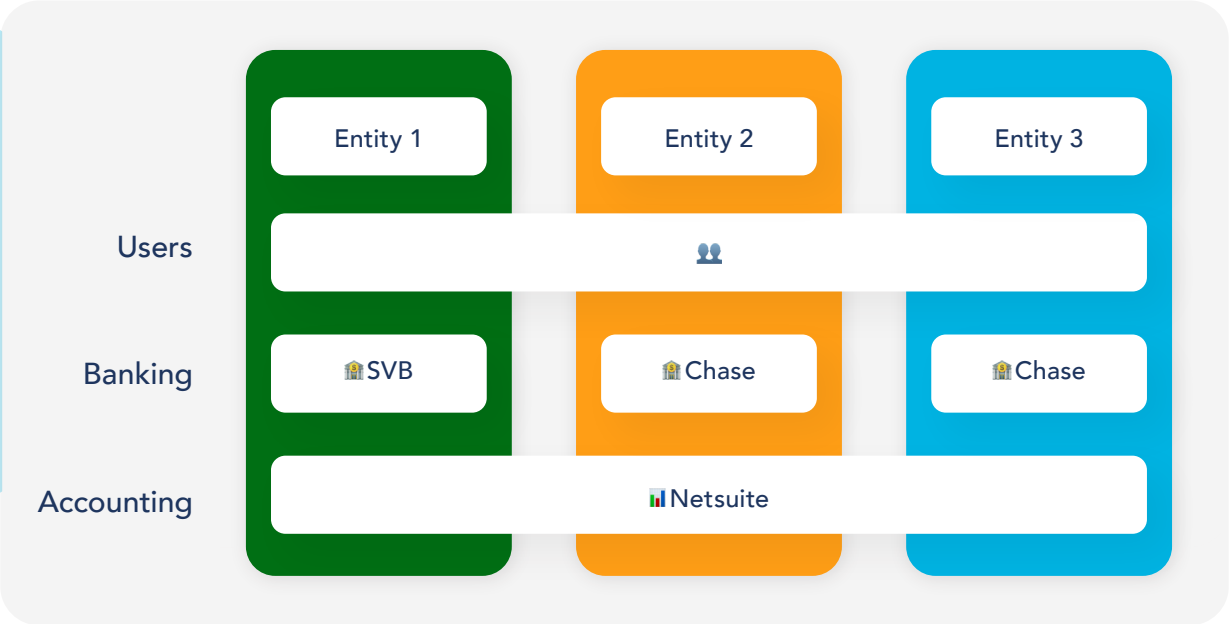

Accounting System

Teampay's robust accounting integrations include Netsuite, Intacct, Quickbooks Online, and Xero. Teampay can support a common accounting system across subsidiaries or different accounting setups between entities.

Teampay can work with a wide variety of multi-subsidiary configurations. Below are two common examples.

Example 1 | The organization has 3 entities all using the same bank account and accounting system.

Example 2 | The organization has 3 entities using different bank accounts and the same accounting system.
